a)
$$L \supset E V$$
: $E_{no} = -V_o + h\omega (n + \frac{1}{2})$

Grundzastand des harmonischen Oszillators

$$U_{no}(r') = \left(\frac{\mu w}{\pi k}\right)^{1/4} e^{-\frac{1}{2}\frac{\mu w}{k}r'^2}$$

$$r' = r - r_b$$

mit charakteristischer Breite

$$\Delta \Gamma_o = \sqrt{\frac{h}{\mu \omega}}$$

Entwicklung zur 3. Ordnung

$$V(r) = -V_0 + a(r-r_b)^2 + b(r-r_b)^2$$

= -V_0 + a \Delta r^2 + b \Delta r^3

es mass gellen b < 0 damit:

$$V \rightarrow \infty$$
, $r \rightarrow 0$
 $V \rightarrow 0$, $r \rightarrow \infty$

quadratische Nähanng

$$V_{c}(r) \triangleq V_{c}(r_{b}) \qquad d.h. \quad V_{c}(r_{b}) \ll E_{n+1,r_{b}} - E_{n,r_{b}}$$

$$V_{c}(r_{b}) = \frac{e(e+1)t^{2}}{2\mu r_{b}^{2}}$$

Betachte Andering von
$$\Delta E$$
 für $r=r_b \rightarrow r=r_b+E$; $\Delta V = |\frac{\partial V}{\partial r}| \Delta r$

· "reines" Molekil potential

$$\Delta V3a. \Delta r^2 = \frac{\mu w^2}{2} \Delta r^2 = \frac{\mu}{2} w^2 \frac{tr}{\mu w} \frac{\delta r^2}{\delta r_b^2}$$
$$= \frac{\hbar w}{2} \frac{\Delta r^2}{\delta r_b^2}$$

· Zentrifugal potential

$$\Delta V_{c} \simeq \frac{\partial}{\partial r} (V_{c}) \Delta r = \frac{2\mathcal{L}(\ell+1) + n^{2}}{2\mu r_{b}^{2}} \Delta r$$

$$= \frac{2V_{c}(r_{b})}{r_{b}} \Delta r \ll 2\hbar \omega \frac{\Delta r}{r_{b}}$$

$$= \frac{\Delta V_c}{\Delta V} \ll \frac{4\Delta V}{r_b \Delta V^2} \Delta V_o^2 \ll \frac{4\Delta r_b}{\Delta r_b} \ll 1$$

=> & Vc viel Gleiner als AV > Vc(v) & Vc(v)

d) $V_c(r) \approx V_c(r_b)$

$$\left(-\frac{tr^2}{2\mu}\partial_r^2 + V(r) + \frac{\ell(\ell+1)t^2}{2\mu r_b^2}\right) u_{ne}(r) = E_{ne} u_{ne}(r)$$

$$\begin{array}{ll}
\Delta V = V - V_b \\
\stackrel{(=)}{(=)} & \left(-\frac{h^2}{2\mu} \partial_{\Delta r}^2 + a_{\Delta r}^2 \right) U_{ne} \left(\Delta r + v_b \right) \\
\partial_r^2 \rightarrow \partial_{\Delta r}^2 \\
&= \left(E_{ne} - \frac{\ell(\ell+1)h^2}{2\mu v_b^2} + V_o \right) U_{ne} \left(\Delta r + v_b \right)
\end{array}$$

Ene =
$$ti\omega(n+\frac{1}{2}) + \frac{\ell(\ell+1)t\ell}{2\mu r_0^2} - V_0$$
